Defining OD

For intersection 1;

Similarly,

For intersection 2;

For intersection 1;

electing 4, 6 & 7, as “**Origins**”

The total number of vehicles is equal to that of sum of all digits in the **student ID * 1000**.
Therefore,

$$\begin{aligned}
 \text{Number of vehicles} &= (1+8+0+7+0+1+0+2+5) * 1000 \\
 &= 21 * 1000 \\
 &= 21,000 \text{ vehicles}
 \end{aligned}$$

The vehicles are now evenly distributed in six OD pairs evenly as $21,000/6 = 3,500$ vehicles.

For Intersection 1-

The vehicles are now evenly distributed in six OD pairs evenly as $21,000/6 = 3,500$ vehicles.

OD Pair (O, D)	Vehicles

Comments

Notable parameters identified from the outputs by converting the [xml files to xlsx files](#) are,

Parameters	Values
Queue Time	569 seconds
Queue Length	412.94 meters
Mean Waiting Time	248.14 seconds
Mean Travel Time	687.22 seconds

All the parameters value are very high. From the simulation it is seen that, most of the queue is formed at the T junction shown below,

Some key solutions can be

1. Increasing lane numbers

2. Channelization (For Left turning vehicles)
3. Actuated Signals
4. Interchange (Cloverleaf)
